## Istruzioni per la verniciatura di pezzi che hanno già ricevuto la mano di fondo

<b>IT</b>		Rettificare accuratamente il componente con la mano di fondo (P800-P1000). Evitare di rettificare attraverso la mano di fondo.
		Verificare la presenza di eventuali punti difettosi, ripararli e rettificare accuratamente i punti riparati (P800-P1000). Riapplicare la mano di fondo sui punti rettificati con l'ausilio di un apposito applicatore in plastica.
		Pulire a fondo utilizzando un decapante a base di silicone.
		Durante la verniciatura, è importante assicurare un sostegno adeguato per i componenti (rischio di distorsione)! Preparazione della vernice e tecnica di applicazione secondo il produttore della vernice; gli additivi elasticizzati indicati dal produttore della vernice sono particolarmente importanti. La designazione del materiale è visibile all'interno del componente (>.....<, ad es. >PUR-MF15<).
		<b>Non essiccare artificialmente la vernice (max. 40°C)!</b>
